Freelance Javascript Developer

Our client is an environmental charity which operates a scheme which mobilises Christians and churches to care for the environment. As a result of the scheme's success, they have invested in a significant upgrade to the software platform that supports the programme using a one-time development opportunity. We are now seeking a skilled and experienced Javascript developer to provide a modest level of on-demand support and undertake occasional development projects to add further functionality (potentially these could be quite significant in time).

We are looking for an experienced fullstack JavaScript developer with experience of React.js and ideally serverless API development (AWS Lambda). The system to be maintained is a React.js web app using the Semantic-UI framework with a backend API running on AWS (API Gateway, Lambda, DynamoDB). The code is well commented and lives in a Git repository on GitLab. AWS deployment is through Claudia.js

The suitable JavaScript Developer will be working for a leading but small charity making a big difference in environmental care in the UK. Ideally, we are seeking someone who is as passionate about the environment as they are about writing code.

Person specification:

Essential skills/experience

- Strong Javascript skills (incl ECMA6) both in the browser and on Node.js

- React.js

- Strong UI/UX development experience

Desirable skills/experience

- Serverless development

- AWS development (incl. understanding of IAM roles/permissions)

- NoSQL database development (incl. optimising data for efficient querying)
